

The TMT 2-Way Hydraulic Ball Valve Assembly is a high pressure 2-way ball valve and a double acting hydraulic cylinder that is able to open and close the valve using hydraulic power alone. The hydraulic cylinder is mounted such that it cannot overload the stem of the ball valve, and hence can reliably and safely actuate the valve 90°. The actuator is compact and lightweight, meaning that it can be mounted in line with hydraulic tubing if required, but it also includes mounting slots so that it can be secured separately.

Features:

- Corrosion resistant SS components
- Compact and easily operated by an ROV
- 90° operation
- Various mounting options available

Specifications:
