

The TMT FLX Marine Growth Cover (MGC) is an economical way of protecting the FLX subsea receptacles from excessive marine growth build up and eliminates time consuming cleaning processes that could be required prior to operation.

The MGC is retained by an O-ring installed on the inside of the lid and a polyurethane rod, which also assists with centralizing tool for insertion. A lanyard is provided to tie back to the structure.

The TMT MGC can be customised to suit most applications. All TMT MGCs are designed to last over 40 years in the subsea environment.

Features:

- Corrosion resistant materials
- Easy to install and remove
- Field proven
- Handle suits different manipulator Jaw configurations
- Land out indicator
- Lanyard
- Titanium bolts
